

## Amendments to the Claims

1. (currently amended): A communication system including a communication network performing at least one communication with at least one subscriber unit over a radio communication link, the communication system having a plurality of different characteristics and characterized by comprising:

means for transmitting dynamic system information relating to the status of the communication system from the communication network to the at least one subscriber unit, the dynamic system information transmitted to the at least one subscriber unit and comprising a resource allocation ~~related to~~ for at least one other subscriber units other than the at least one subscriber unit; from the communication network to the at least one subscriber unit, and

the at least one subscriber unit comprising means for receiving the dynamic system information and means for selecting a preferred value of at least one characteristic of a communication in the communication system in response to the resource allocation~~[[, ]]~~; and

means for setting the at least one characteristic of the communication in the communication system to said preferred value of the at least one characteristic.

2. (previously presented): A communication system as claimed in claim 1 wherein the at least one characteristic of the communication system is a characteristic of the communication between the communication network and the at least one subscriber unit.

3. (previously presented): A communication system as claimed in claim 1 wherein the means for setting the at least one characteristic of the communication system to said preferred value is located in the subscriber unit.

4. (previously presented): A communication system as claimed in claim 1 wherein the means for setting the at least one characteristic of the communication system to said preferred value is located in the network.

5. (previously presented): A communication system as claimed in claim 1 wherein the dynamic system information is broadcast to all subscriber units.
6. (previously presented): A communication system as claimed in any claim 1 wherein the dynamic system information is transmitted to a specific group of subscriber units.
7. (previously presented): A communication system as claimed in any claim 1 wherein the dynamic system information is transmitted to individual subscriber units.
8. (previously presented): A communication system as claimed in claim 1 wherein the dynamic system information transmitted includes a characteristic chosen from the group of
- a) a traffic load,
  - b) a traffic mix,
  - c) the location of the subscriber units,
  - d) the capabilities of subscriber units active in the system,
  - e) the capabilities of the network,
  - f) the available resources of the network,
  - g) a tariff,
  - h) availability of service providers,
  - i) capability of service providers,
  - j) availability of other communication systems,
  - k) capability of other communication systems, and
  - l) available services.
9. (previously presented): A communication system as claimed in claim 1 wherein the least one characteristic of the communication system is chosen from the group of:
- a) time of communication,

- b) communication needs,
- c) a prioritization of communication,
- d) a communication format,
- e) an data rate,
- f) a service provider,
- g) a communication system,
- h) a service, and
- i) a handover.

10. (previously presented): A communication system as claimed in claim 1 wherein the subscriber units further comprises means for presenting the dynamic system information to the user.

11. (previously presented): A communication system as claimed claim 1 wherein the subscriber units further comprise means for receiving a user input and the at least one characteristic of the communication between the subscriber unit and the network is determined in response to this user input.

12. (previously presented): A communication system as claimed in claim 1 wherein the subscriber units further comprise means for communicating the dynamic system information to an external device.

13. (previously presented): A communication system as claimed in claim 1 wherein the subscriber units further comprise means for receiving an input from an external device and the at least one characteristic of the communication system is determined in response to this input from an external device.

14. (previously presented): A communication system as claimed in claim 12 3 wherein the external device is a Smartcard.

15. (previously presented): A communication system as claimed in claim 1 further comprising:

means for the subscriber unit to request the network to change the at least one characteristic of the communication system, and

means for the network to change the at least one characteristic of the communication system in response to said request.

16. (previously presented): A communication system as claimed in claim 15 wherein a distribution of resource is changed.

17. (previously presented): A communication system as claimed in claim 16 wherein the communication system uses a Code Division Multiple Access scheme and the distribution of resource is changed by changing the allocation of spreading codes between the base stations.

18. (previously presented): A communication system as claimed in claim 16 wherein the communication system uses a Frequency Division Multiple access scheme and the distribution of resource is changed by changing the allocation of frequencies between the base stations.

19. (previously presented): A communication system as claimed in claim 1 which is a cellular mobile communication system and the subscriber units are mobile stations.

20. (previously presented): A communication system as claimed in claim 19 which is a GSM cellular mobile communication system.

21. (currently amended): A method of modifying communication in a communication system including a communication network performing at least one communication with at least one subscriber unit over a radio communication link, the communication system having a plurality of different characteristics, said method being characterized by comprising the steps of:

transmitting dynamic system information relating to the status of the communication system from the communication network to the at least one

subscriber unit, and the dynamic system information transmitted to the at least one subscriber unit comprising a resource allocation related to for at least one other subscriber units other than the at least one subscriber unit from the communication network to the at least one subscriber unit[[.]]; and

receiving the dynamic system information and selecting a preferred value of at least one characteristic of a communication in the communication system in response to the resource allocation at the at least one subscriber unit[[.]]; and

setting the at least one characteristic of the communication in the communication system to said preferred value of the at least one characteristic.

22. (previously presented): A method of modifying communication in a communication system as claimed in claim 21 wherein the dynamic system information is broadcast to the subscriber units.

23. (previously presented) A method of modifying communication in a communication system as claimed in claim 21 wherein the dynamic system information transmitted includes a characteristic chosen from the group of

- a) a traffic load,
- b) a traffic mix,
- c) the location of the subscriber units,
- d) the capabilities of subscriber units active in the system,
- e) the capabilities of the network,
- f) the available resources of the network,
- g) a tariff,
- h) availability of service providers,
- i) capability of service providers,
- j) availability of other communication systems,
- k) capability of other communication systems, and
- l) available services.

24. (previously presented): A method of modifying communication in a communication system as claimed in claim 21 wherein the at least one characteristic of the communication system is chosen from the group of:

- a) time of communication,
- b) communication needs,
- c) a prioritization of communication,
- d) a communication format,
- e) an data rate,
- f) a service provider,
- g) a communication system,
- h) a service, and
- i) a handover.

25. (previously presented): A method of modifying communication in a communication system as claimed in claim 21 further comprising the step of communicating the dynamic system information to an external device.
